

Differentiating Cannabis and Hemp:

An Evaluation of Some HPLC Methodologies

Craig S. Young
HPLC Product Manager

Cannabinoids of current interest in cannabis and hemp

d9-Tetrahydrocannabinol
(d9-THC)

d8-Tetrahydrocannabinol
(d8-THC)

d9-Tetrahydrocannabinolic acid
(THCA)

Tetrahydrocannabivarin
(THCV)

Cannabichromenic acid
(CBCA)

Cannabicyclol
(CBL)

Cannabichromevarin
(CBCV)

Cannabidiol
(CBD)

Cannabidiolic acid
(CBDA)

Cannabinol
(CBN)

Cannabidivarin
(CBDV)

Tetrahydrocannabivarinic acid
(THCVA)

Cannabidivarinic acid
(CBDVA)

Cannabidiphorol
(CBDP)

Cannabigerol
(CBG)

Cannabigerolic acid
(CBGA)

Cannabichromin
(CBC)

Cannabichromeorcin
(CBCO)

Cannabicitran
(CBT)

d8-Tetrahydrocannabinolic acid
(d8-THCA)

d9-Tetrahydrocannabiphorol
(d9-THCP)

Cannabinoids of current interest in cannabis and hemp

d9-Tetrahydrocannabinol
(d9-THC)

d8-Tetrahydrocannabinol
(d8-THC)

d9-Tetrahydrocannabinolic acid
(THCA)

Tetrahydrocannabivarin
(THCV)

Cannabichromenic acid
(CBCA)

Cannabicyclol
(CBL)

Cannabichromevarin
(CBCV)

Cannabidiol
(CBD)

Cannabidiolic acid
(CBDA)

Cannabinol
(CBN)

Cannabidivarin
(CBDV)

Tetrahydrocannabivarinic acid
(THCVA)

Cannabidivarinic acid
(CBDVA)

Cannabidiphorol
(CBDP)

Cannabigerol
(CBG)

Cannabigerolic acid
(CBGA)

Cannabichromin
(CBC)

Cannabichromeorcin
(CBCO)

Cannabicitran
(CBT)

d8-Tetrahydrocannabinolic acid
(d8-THCA)

d9-Tetrahydrocannabiphorol
(d9-THCP)

Cannabinoids of current interest in cannabis and hemp

d9-Tetrahydrocannabinol
(d9-THC)

d8-Tetrahydrocannabinol
(d8-THC)

d9-Tetrahydrocannabinolic acid
(THCA)

Tetrahydrocannabivarin
(THCV)

Cannabichromenic acid
(CBCA)

Cannabicyclol
(CBL)

Cannabichromevarin
(CBCV)

Cannabidiol
(CBD)

Cannabidiolic acid
(CBDA)

Cannabinol
(CBN)

Cannabidivarin
(CBDV)

Tetrahydrocannabivarinic acid
(THCVA)

Cannabidivarinic acid
(CBDVA)

Cannabidiphorol
(CBDP)

Cannabigerol
(CBG)

Cannabigerolic acid
(CBGA)

Cannabichromin
(CBC)

Cannabichromeorcin
(CBCO)

Cannabicitran
(CBT)

d8-Tetrahydrocannabinolic acid
(d8-THCA)

d9-Tetrahydrocannabiphorol
(d9-THCP)

The Chemistry of Decarboxylation

Cannabis/Hemp and Industry Background

- QC testing for cannabinoids is essential for the accurate labeling of cannabis products in both medical and recreational cannabis markets. Cannabis “potency” is normally reserved for the quantitation of the major cannabinoids, principally THCA, and d9-THC, and CBD.
- **HPLC** has emerged as the gold standard for potency determinations because separation and detection of all cannabinoids is done without causing any decomposition of the THCA.

Cannabis/Hemp and Industry Background

CBD is non-psychoactive, but valuable for its medicinal properties:

- Pain mitigation
- Calming
- Anti-seizure
- Anti-nausea

The main source of CBD-rich oil is industrial hemp. Hemp is considered a rustic plant as it is frost resistant, adapts to poor soil, reproduces easily, and does not require chemical fertilizers, pesticides, herbicides, or fungicides to thrive. A hemp crop tends to resist mildew and requires less water than cotton. Hemp textiles are considered softer than cotton.

Cannabis/Hemp – The Legal Definition

U.S. Hemp Farming Act, December, 2018

The law differentiates hemp from cannabis on the basis of its d9-THC content. Hemp is considered $< 0.3\%$ by dry weight.

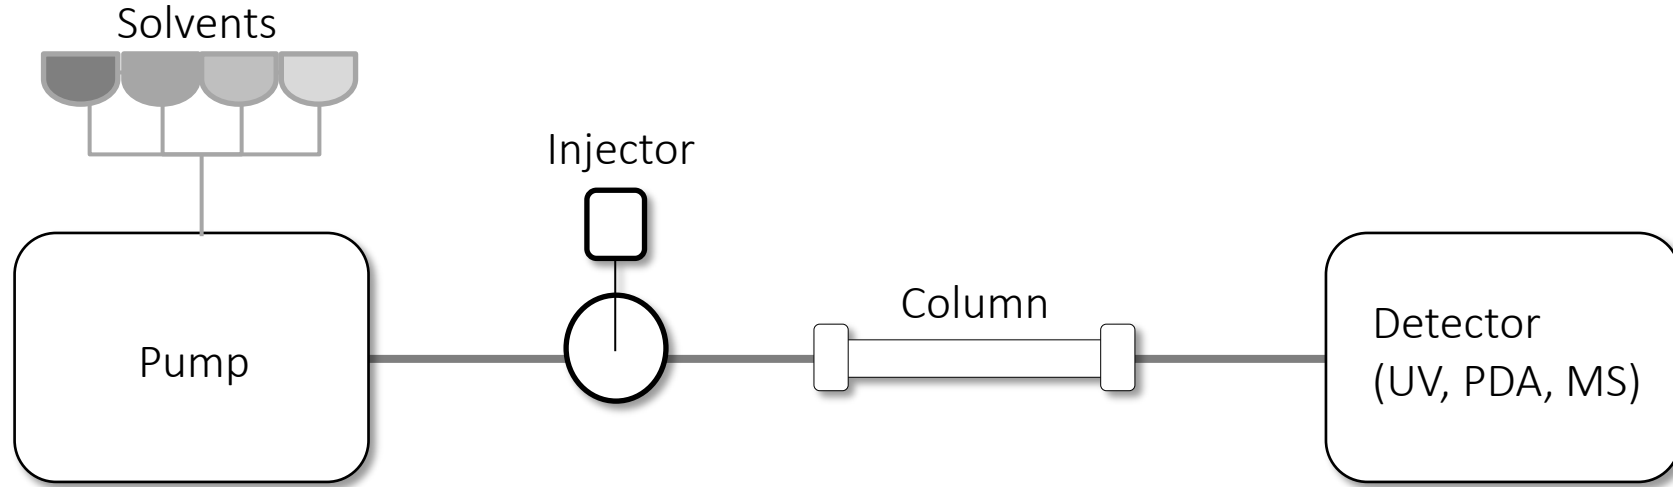

USDA Interim Final Rule, October, 2019

1. Labs conducting chemical analysis must be DEA registered to handle materials exceeding the 0.3% limit.
2. Redefinition of 0.3%. The "Total THC Rule." Hemp is now defined as a product with no more than **0.3% Total THC** in order to take into account its potential for total psychoactive content. Testing must either be performed "post-decarboxylation" -OR- the Total THC must be taken into account, which is the sum concentration of THC-A and d9-THC.

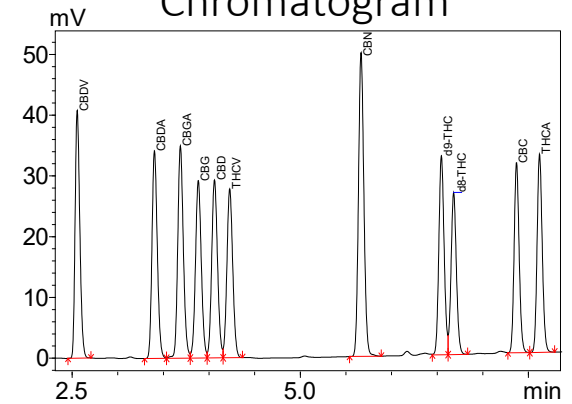

Potency Testing by HPLC

HPLC – High Performance Liquid Chromatography

Chromatogram

Potency Testing by HPLC – Instrumentation

Cannabis and Hemp Analyzers

- Based on i-Series Integrated HPLC
- Built-in UV or Diode Array
- Complete, turn-key packages

Mobile Phase

Certified Standards

Column, Guard Columns

App Notes Reports

Method Package

40-Series Modular (U)HPLC

- HPLC/UHPLC
- Flexible/Expandable
- High throughput capable
- AI features
- Superb MS front end

Potency Testing by HPLC – Instrumentation

- HPLC
- Cannabinoids: 10-11
- Medium Throughput - 10 minutes

- UHPLC
- Cannabinoids: 16
- High Throughput - 5 minutes

The Cannabis Analyzer for Potency

Mobile Phase

Certified Standards

Column, Guard Columns

App Notes Reports

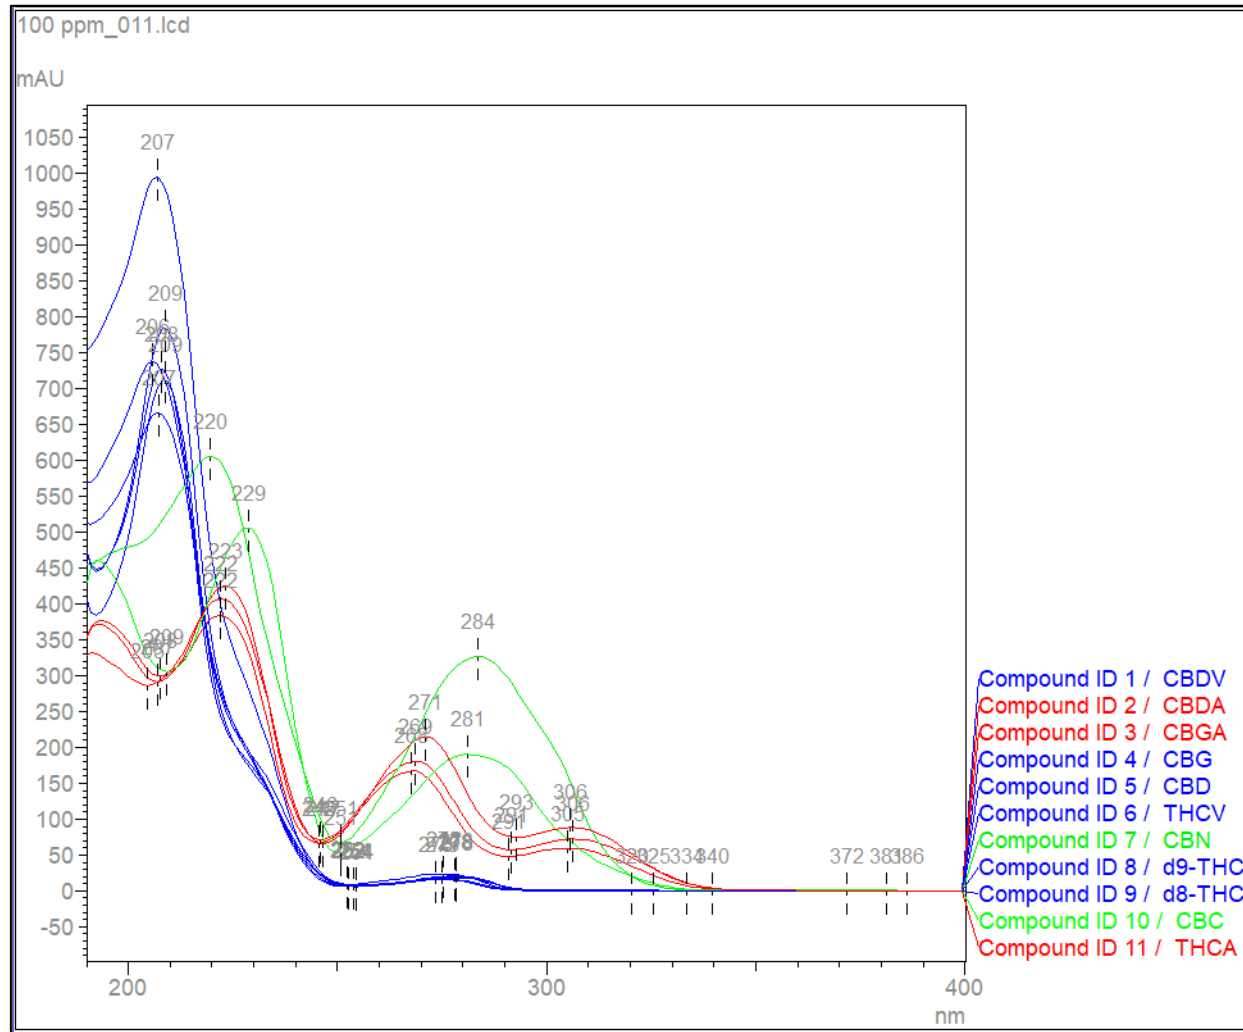

Method Package

High Sensitivity Method

- The most popular Analyzer method.
- Forgiving, dependable workflow, yet with reasonable sample time frame and good resolution.
- Quantitative for 11 cannabinoid targets incl. THCV – 144 samples per 24 hr. day
- Sensitivity (ug/mL; ppm; 0.1% by dry weight)

The Value of LC with Diode Array Detection

- For Cannabinoids, diode array detection may be diagnostic for cannabinoid class. (e.g. CBD vs CBDA; THC vs. THCA; etc.)
- It is not diagnostic for individual cannabinoids within a class. (e.g. CBD is indistinguishable from CBG)

The Value of Diode Array Detection

i-PDeA II

Peak deconvolution made simple and automatic. The result is a virtual separation that can be used for quantitative determinations.

i-PDeA is a Shimadzu exclusive!

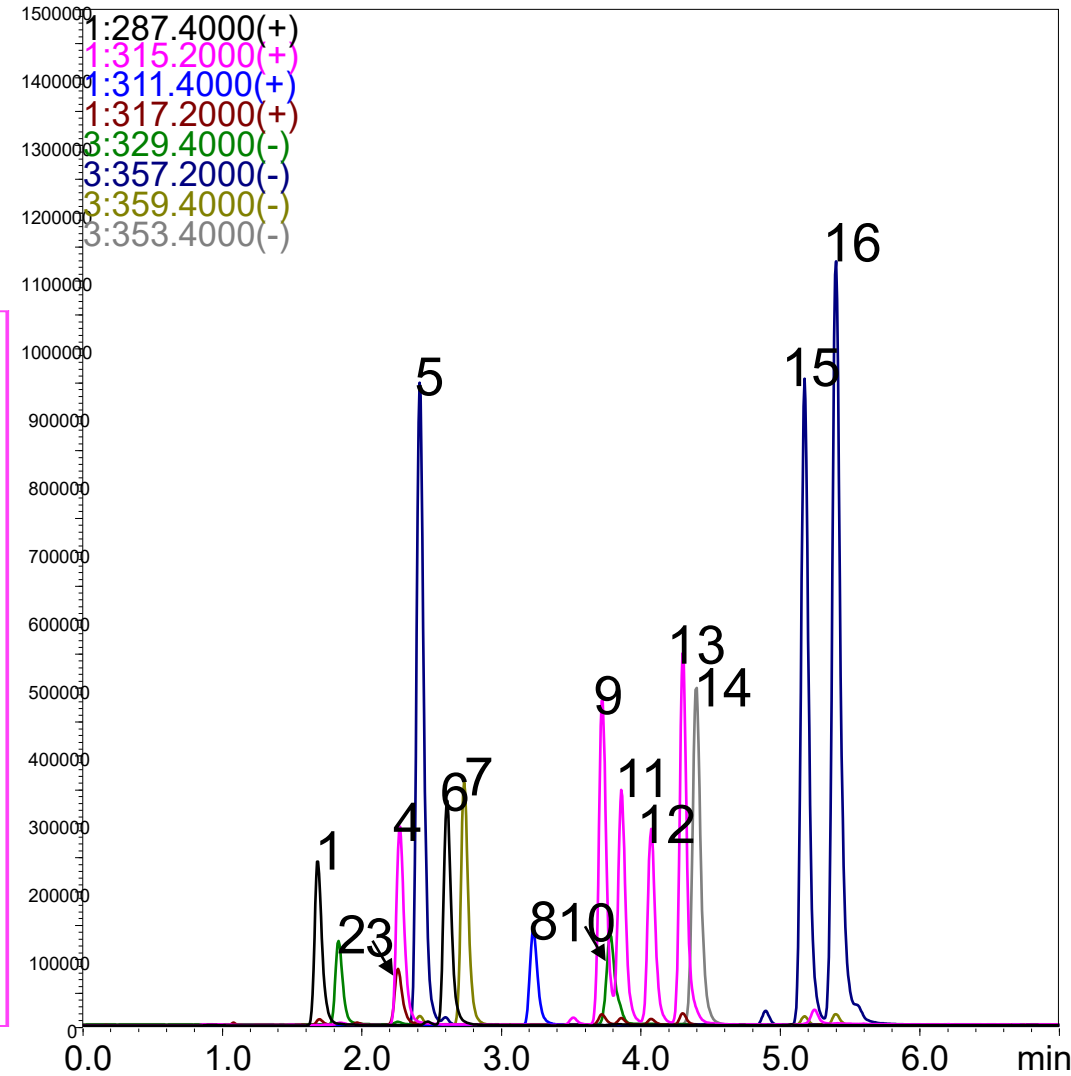

Separate
Data
Channels

Using Single Quadrupole MS

i-Series LC-2050 (U)HPLC and LCMS-2020

- Mass-specific characterization
- Minimized matrix effects
- High sensitivity – ng/mL (ppb)
- Isobars are un-differentiated by MS alone

Using Triple Quadrupole MS

40-Series X3 (U)HPLC and LCMS-8060

- Mass-specific characterization
- Minimized matrix effects
- Highest sensitivity – fg/mL to pg/mL
- The ultimate in target specificity – mass transitions (fragment ions)
- Isobars are un-differentiated by MS alone

Target cannabinoids in Positive Mode

- * $[M+H]^+$ with multiple transitions
- * Incl. deuterium-labeled internal standards

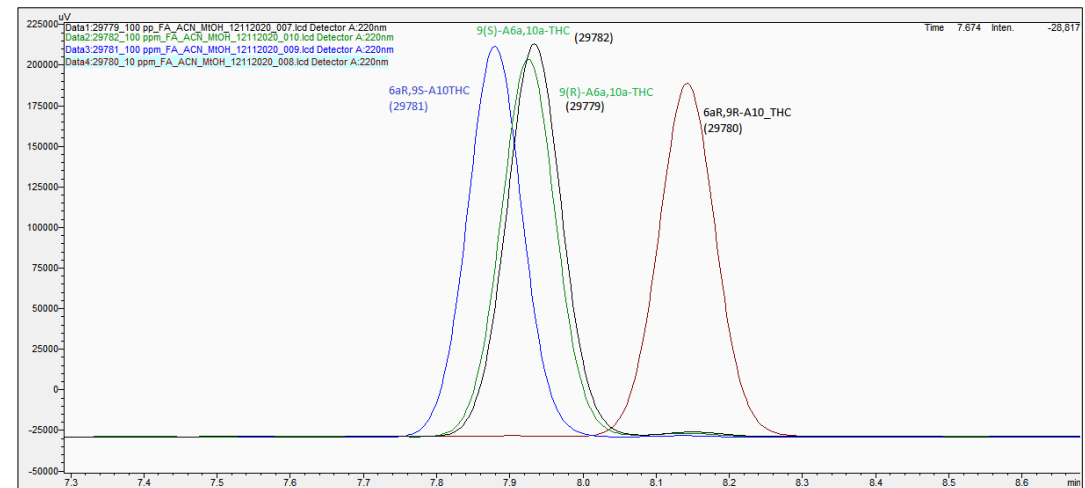

Topics of Current Interest

9(R)- $\Delta^{6a,10a}$ -THC
 9(S)- $\Delta^{6a,10a}$ -THC
 (6aR,9S)- Δ^{10} -THC
 (6aR,9R)- Δ^{10} -THC

- Interest in new targets driven by academic research –AND- availability of standards
- Chiral pairs difficult to separate
- Diastereomeric pairs readily separated
- May prove impractical in reasonable time frames for real samples.
