# Czech experts in talks over Semtex

By Michael Evans, Defence Correspondent

Four Czech plastic explosives technicians who had five hours of talks with Ministry of Defence scientists at the Foreign Office yesterday provided valuable information for those investigating the Lockerbie air disaster.

But they could not help to prove whether the explosive used to destroy the Pan Am jet was Semtex, which is made in Czechoslovakia.

The residues of explosive found by the investigators were too small, according to Whitehall sources yesterday. Mr Paul Channon, Secretary of State for Transport, told the Commons earlier this week that it was probably Semtex.

The Czech experts were shown photographs of the Pan Am wreckage and they discussed the disaster in detail with four scientists from the Ministry of Defence's Royal Armaments Research and Development Establishment based at Fort Halstead in Kent. They are expected to return to Prague today.

They were asked about the possibility of marking Semtex

exported Semtex for years. British intelligence believes it was last exported in 1982.

So, although it would be too late to mark the Semtex that has already been sold abroad, huge quantities of which have landed up in Libya and then been given to the IRA and other terrorist groups, a "fingerprinting" system could be vital if the Prague government decided to start exporting the explosive in the future.

● The Prince of Wales is going to visit Lockerbie on January 24 to see the aftermath of the air disaster. Buckingham Palace announced yesterday.

His appearance in the Scottish border town more than a month after the tragedy follows criticism that no member of the Royal Family attended the memorial service for the victims last week.

The Duke of York visited the scene the morning after the crash, and said at the time that while he felt sorry for everyone concerned, he felt particularly sorry for the Americans involved.

The Prince will visit the

# Mock disaster

By Tony Dawe

Britain's biggest switchboard failed to cope yesterday with thousands of calls from "anxious relatives" after a mock disaster resembling the M1 jet crash.

More than 2,500 volunteers flooded British Telecom's Bristol centre, often used for large share flotations, with inquiries about victims. Most calls went unanswered. Only one in four got through to the centre and most callers had to dial several times.

Telecom and the emergency services had hoped the Bristol switchboard might serve as a permanent information number, reducing the delays that have distressed relatives of genuine disaster victims. But after yesterday's exercise, conducted by the Association of Chief Police Officers, one emergency planner said: "The authorities will have to look for

# Surgeons give

By a Staff Reporter

Surgeons treating victims of the M1 jet crash were given financial backing yesterday to help them to research the cause and nature of the injuries suffered and whether rear-facing seats and other changes in aircraft design could have reduced the casualties.

SCHOOL OF CHEMICAL ENGINEERING AND INDUSTRIAL CHEMISTRY

11th May, 1988.

Dr. A. Horna,  
Research Institute of Industrial Chemistry,  
East Bohemia Chemical Works Synthesia,  
532 17 Pardubice - Semtin,  
CZECHOSLOVAKIA.

Dear Dr. Horna,

I imagine that you are aware that The Journal of Chromatography is becoming more and more administered by Klaas Bij as Executive Officer Amsterdam as a lead up to the retirement of the foundation editor Dr. Michael Lederer in early 1989.

It would be of interest to know if you would be prepared to referee occasional manuscript and if so in what areas could you act.

I will eventually handle most papers on GC at least some if not all MS, most on polymers by all techniques some, a minority on HPLC. The arrangement fits in with the interests of the other people to be edited.

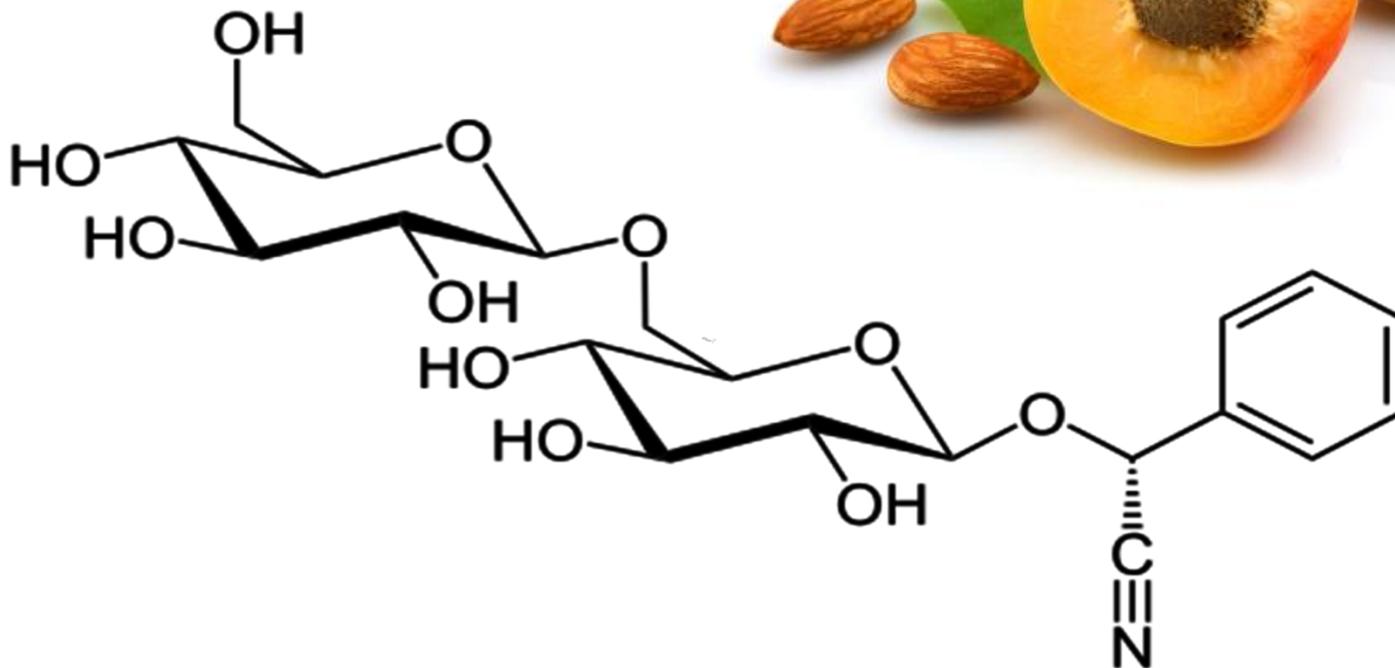

Kind regards,

J.K. Haken,  
Associate Editor.

Amygdalin is the cyanogenic diglucoside, D-mandelonitrile- $\beta$ -D-gentiobioside, MW 457.431

# Amygdalin topic on the WOS page from 1954 to 2017

# VITATOX – Vitamin A toxicity

- Vitamin A toxicity is known to be an ancient phenomenon; fossilized skeletal remains of early humans suggest bone abnormalities may have been caused by hypervitaminosis A.
- Vitamin A toxicity has long been known to the Inuit and has been known by Europeans since at least 1597 when Gerrit de Veer wrote in his diary that, while taking refuge in the winter in Nova Zemlya, he and his men became **severely ill after eating polar bear liver**.
- In 1913, Antarctic explorers Douglas Mawson and Xavier Mertz were both poisoned (and Mertz died) from eating the livers of their sled dogs during the Far Eastern Party. Another study suggests, however, that exhaustion and diet change are more likely to have caused the tragedy.
- **Nejezte játra ledního medvěda a ani psů**

# VITATOX – Vitamin E toxicity

- Hi Ales,
- 
- The safety of large doses of vitamin E went virtually unquestioned until the early 2000s, when several studies were published **showing that consumption of vitamin E from dietary supplements increased mortality, as well as the risk of gastrointestinal cancer and heart failure**. These studies prompted numerous letters to the editors of medical journals and widespread coverage in the media. Both the medical community and the general public became confused and concerned about the use of vitamin E supplements. The purpose of this article is to review the medical literature and to explain these unusual findings. First we provide an overview of the earlier literature on vitamin E. Second, we provide a critical assessment of three meta-analyses that were neutral or negative toward vitamin E supplementation. Third, we review the limitations of meta-analyses in general. Fourth, we assess the individual studies that comprised one of the three meta-analyses. Since all three meta-analyses used many of the same studies, the individual critique should further the understanding of the limitations of these meta-analyses, and the meta-analysis approach in general. Lastly, we offer some guidance for healthcare professionals to give to the general, healthy public and those with chronic conditions who are no doubt left puzzled as to what to do regarding vitamin E supplementation.
- 
- Regards
- Brian

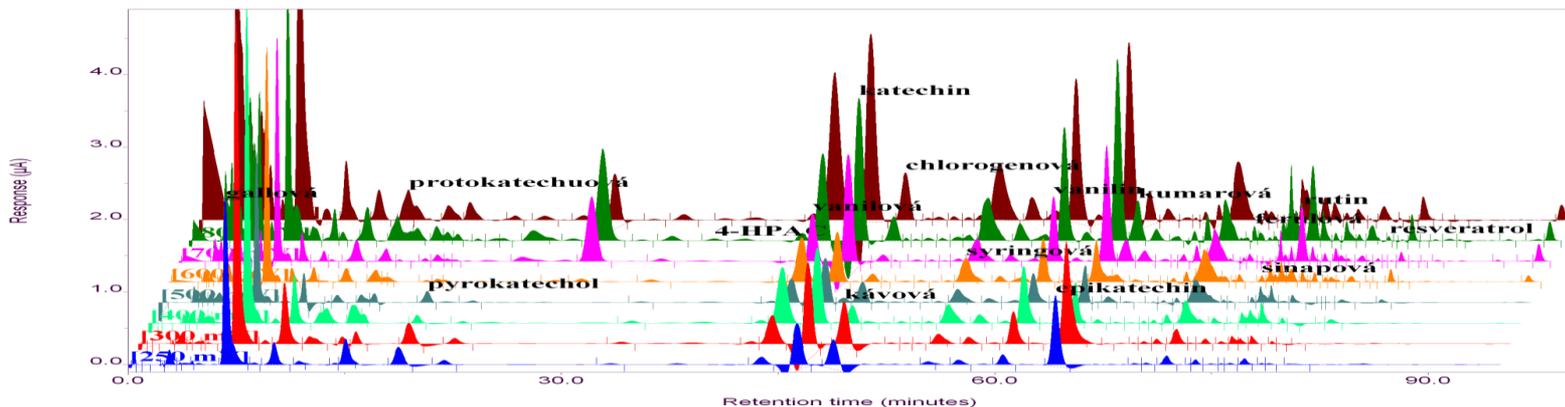

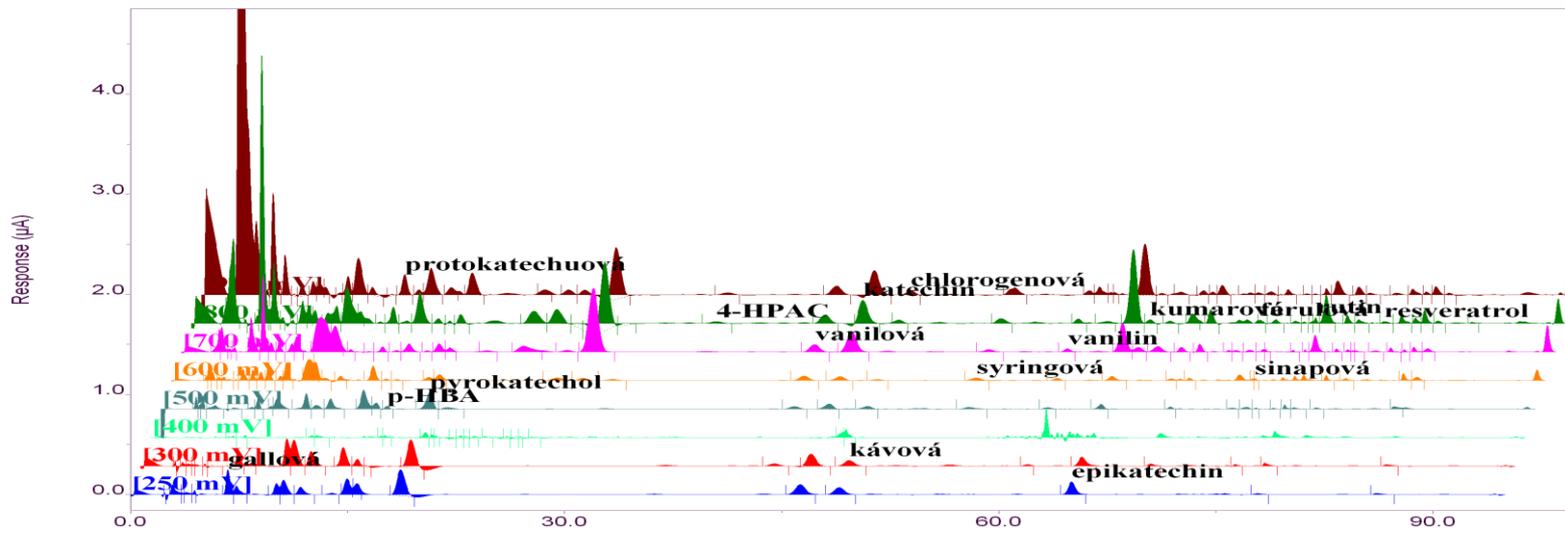

# VITATOX – Vitamin B

- **Homocystein** (systematický název **2-amino-4-sulfanylbutanová kyselina**) je aminokyselina, která vzniká při normálním metabolismu u lidí a jiných savců z aminokyseliny methioninu. Odbourává se na cystein za pomoci vitamínů B (zvláště B<sub>6</sub>, B<sub>12</sub>, kyseliny listové). Nedostatek těchto vitamínů, například ve stravě vegetariánů, anebo vzácná dědičná choroba (homozygotní homocystinurie) mohou vést ke zvýšené hladině homocysteinu v krvi. Americký **lékař McCully** vytvořil v roce 1960 hypotézu, že i mírné zvýšení hladiny homocysteinu může přispívat k nemocem krevního oběhu. Tu popsal v knize *The Homocysteine Revolution*.<sup>[3]</sup>
- Homocystein není nijak škodlivý **????** V poválečné době strachu z A-bomby se používal jako radioprotektivum.
- V České republice se v minulých letech stali propagátorem snižování hladiny homocysteinu **MUDr. Karel Erben** a jím řízený Svaz pacientů. Erben možnost vyšetření hladiny homocysteinu nabízí komerčně. Za „prosazování neověřené metody léčby nádorů snížením hladiny homocysteinu“ mu Český klub Sisyfos udělil Bronzový Bludný balvan za rok 2007.
- Čest jeho památce

# Electrochemical detection in HPLC

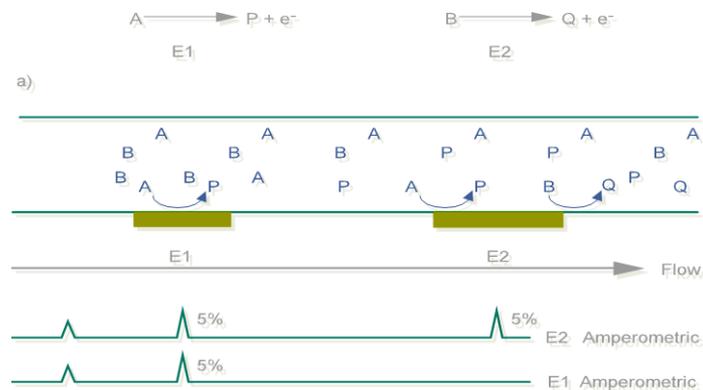

**Prof. Pavel Jandera** and CouloChem II in 1997

- Coulochem - 1 to 2 channel amperometric or coulometric electrochemical cell
- CoulArray- up to 4 series connected electrochemical cells (ESA, Inc., Chelmsford, USA)
- The CoulArray detector is compatible with HPLC gradient elution
- The sample does not need to be specially treated before analysis, for example, when determining the antioxidant activity of electroactive substances in wine, beer, or other beverages, the sample is diluted with MF only and filtered prior to injection
- Jandera P., Škeříková V., Řehová L., Hájek T., Baldriánová L., Škopová G., Kellner V., Horna A.:
- **RP-HPLC analysis of phenolic compounds and flavonoids in beverages and plant extracts using a CoulArray detector. Journal of Separation Science. 2005, 28(9-10), 1005-1022.**

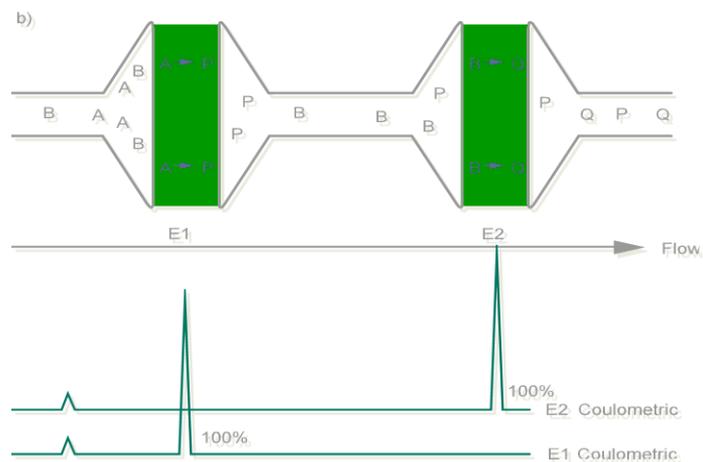

# Chromatogram – standard compounds

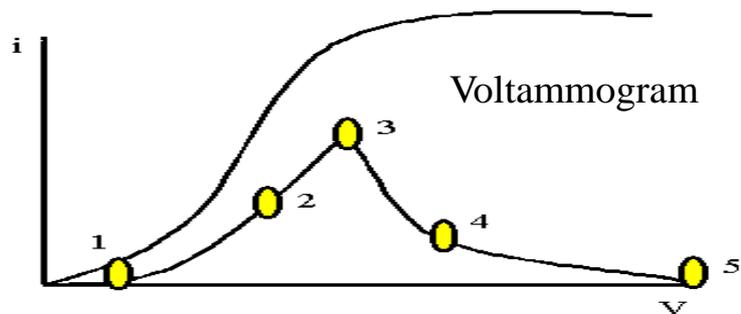

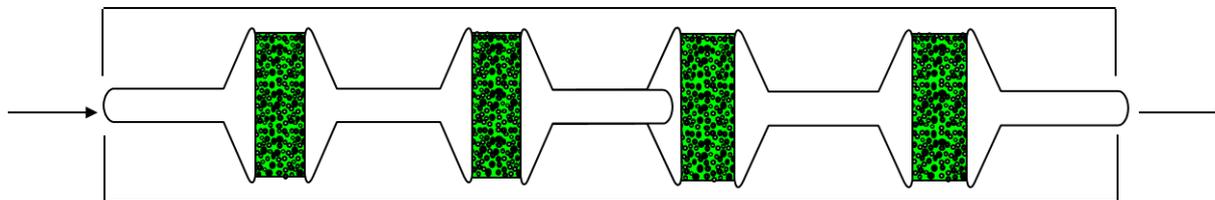

a) Lack Of Selectivity And Sensitivity With Dual Amperometric Electrodes

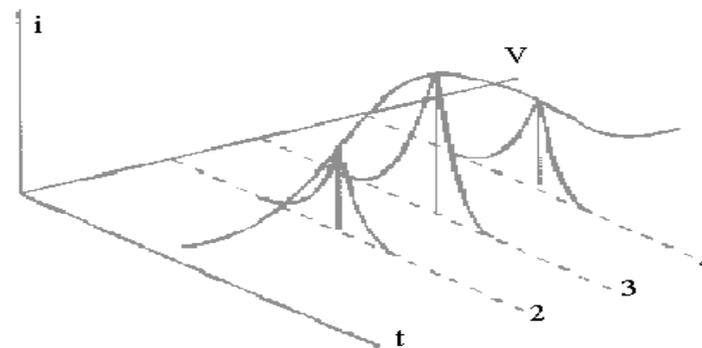

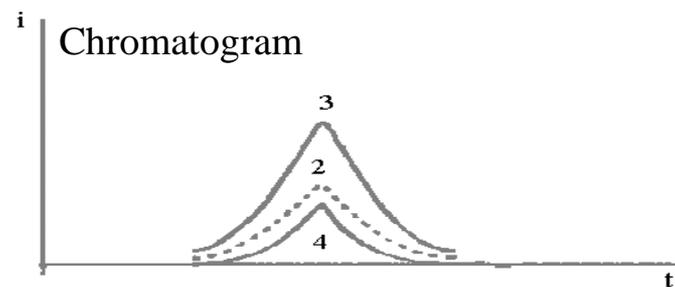

b) Dual Coulometric Electrodes Are Selective And Sensitive

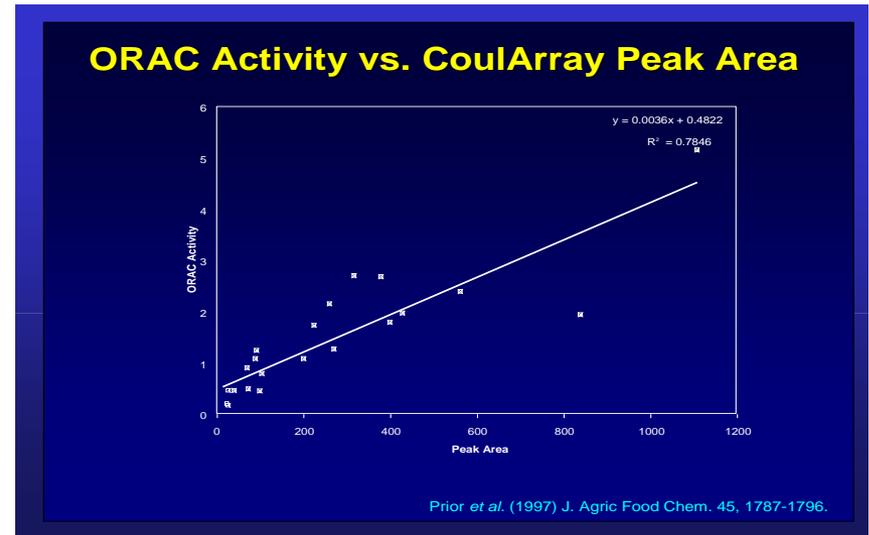

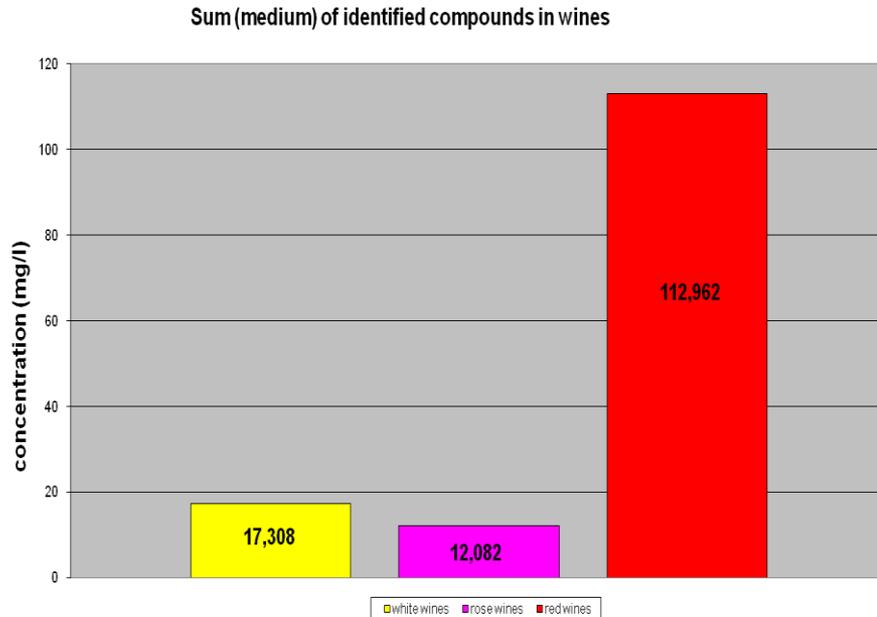

Electrode array

- 2: Pre-dominant
- 3: Dominant
- 4: Post-dominant peaks

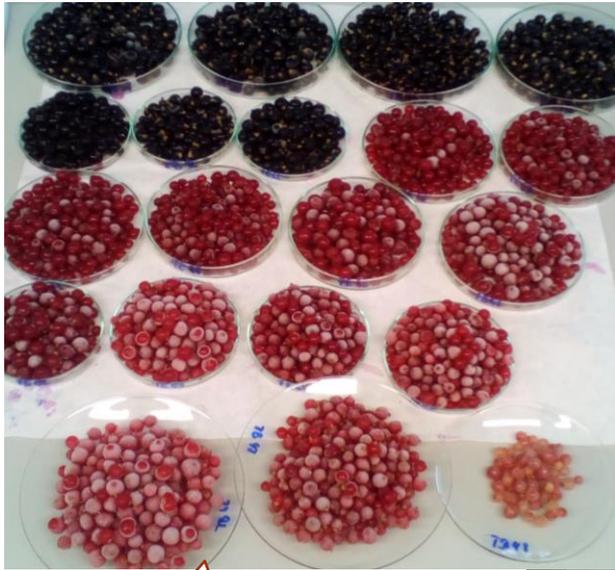

# Estimation of the Overall Antioxidant Capacity

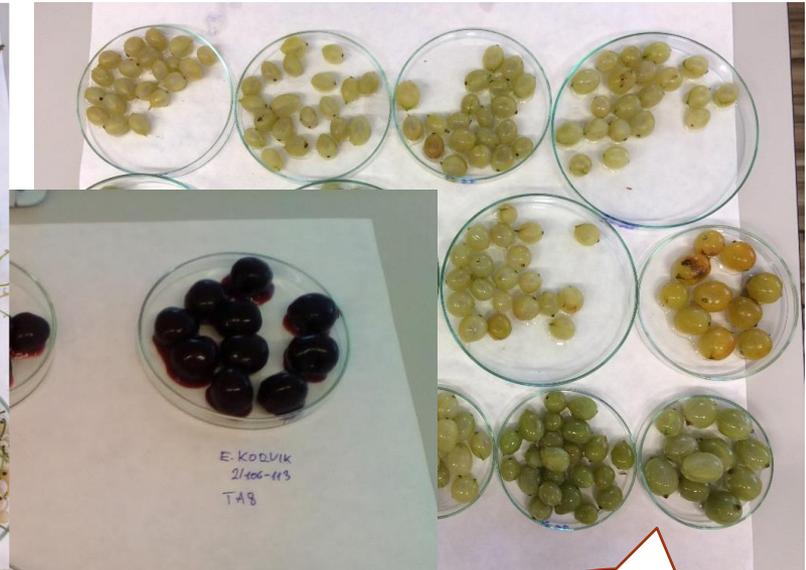

Guo *et al.*, J. Agric. Food Chem., 1997,45, 1787

A relationship between the sum of peak areas of a chromatogram of a plant and the antioxidant capacity of this extract

# Samples

Currants

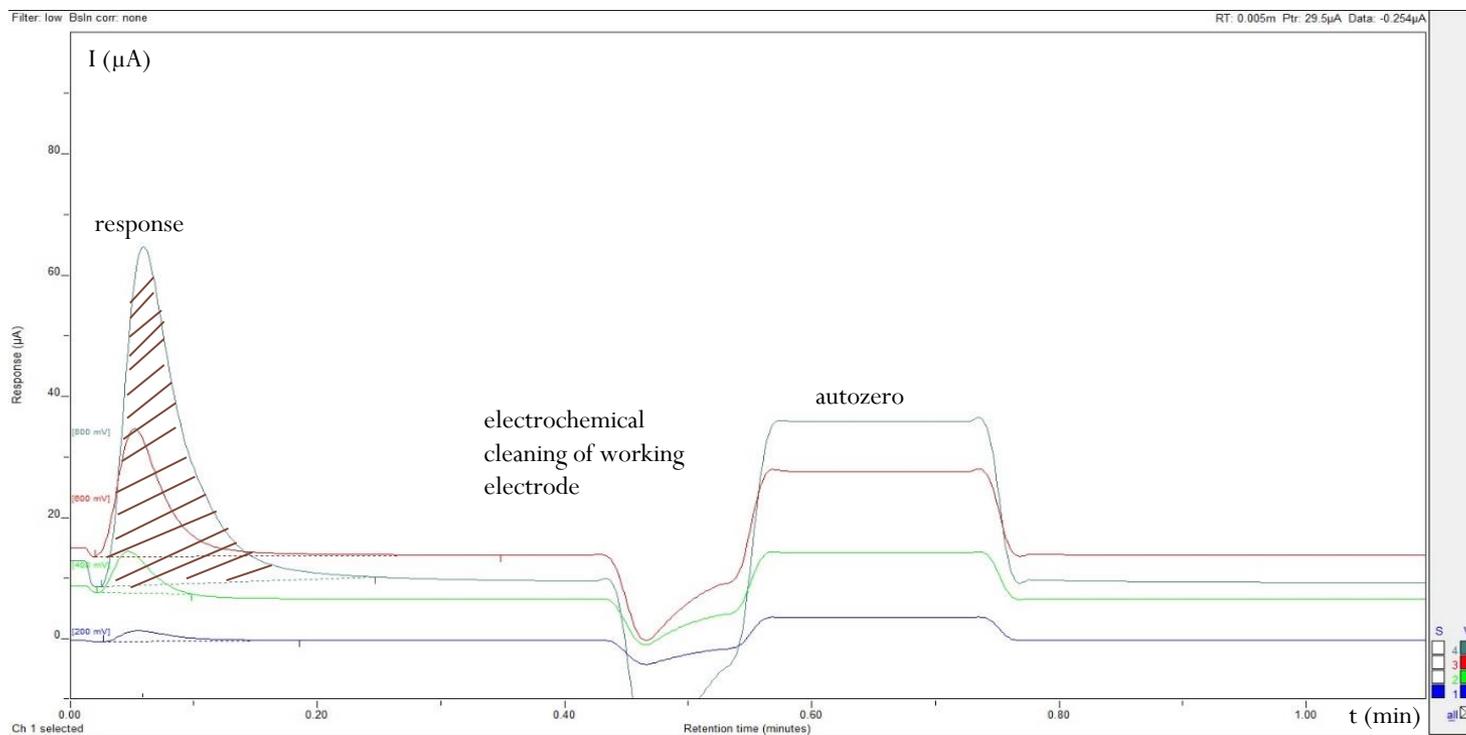

Gooseberries

Cherries

- Automatic peak integration, electrochemical cleaning, autozero
- Total charge as a sum of charges at 200,400,600, 800 mV

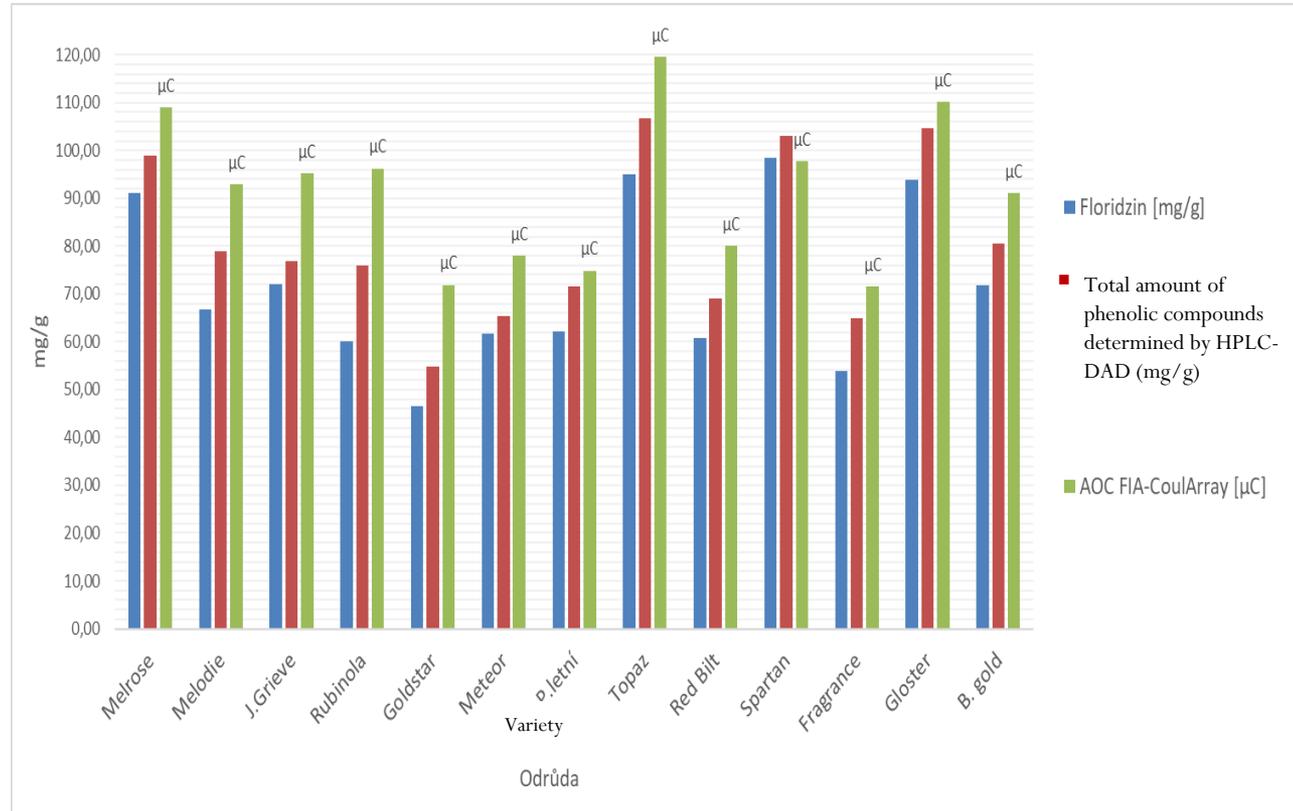

# FIA/ECD and HPLC/DAD correlation

Total mg of phenolic compounds determined by HPLC/DAD and FIA-CoulArray

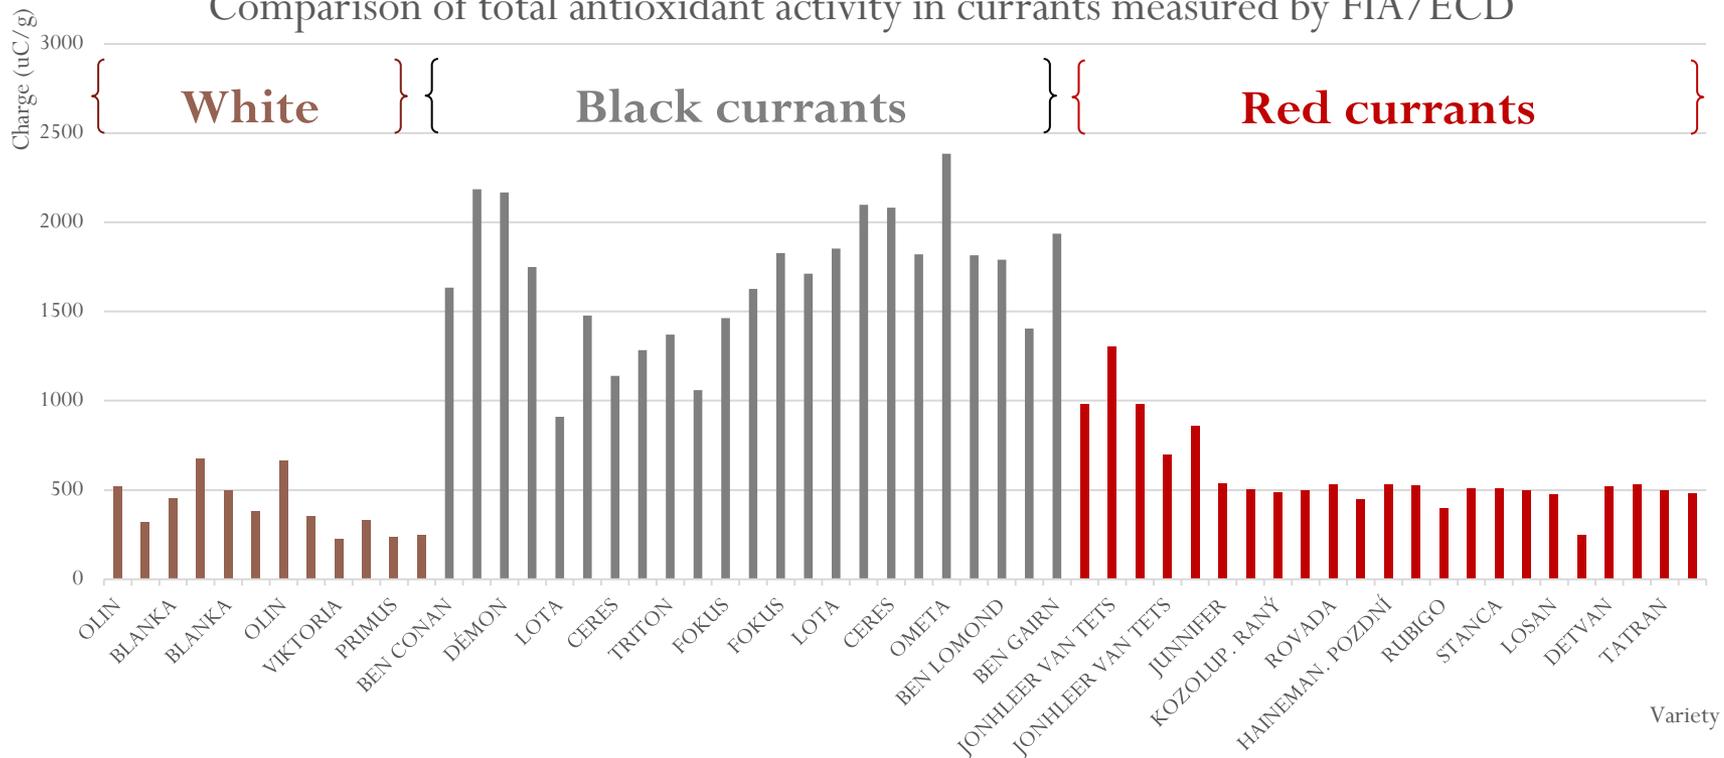

(confirmed by 12/13 varieties)

The FIA seems to be suitable as a rapid screening method for cross-species comparison.

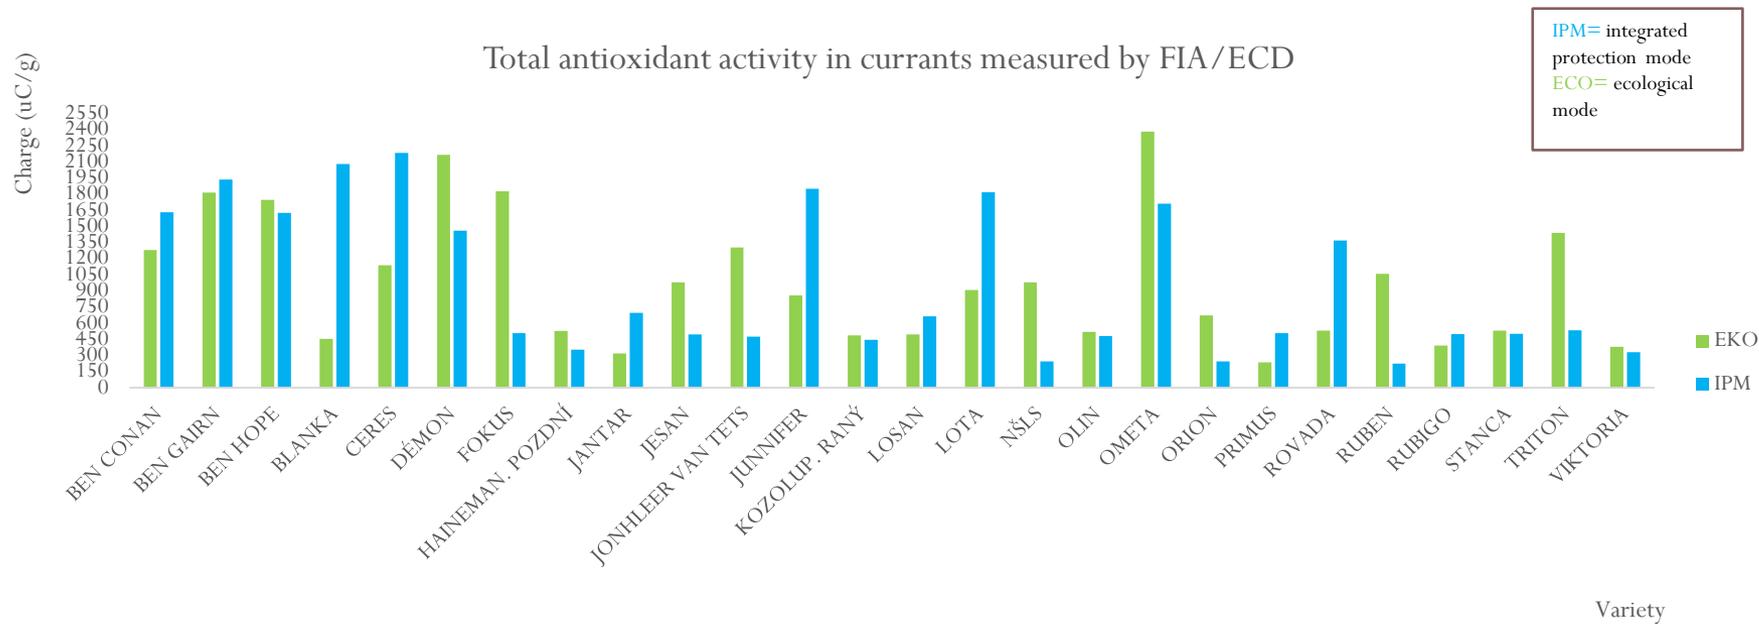

This is followed by separation and quantification by HPLC-DAD.

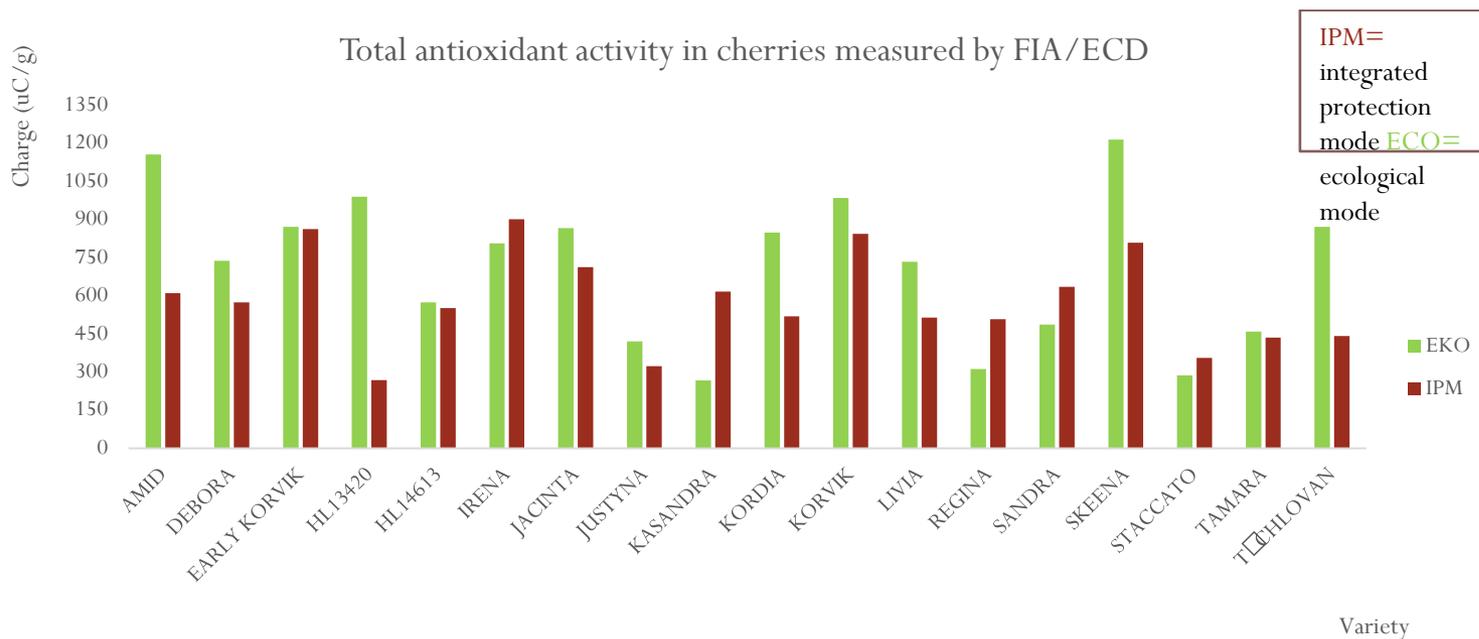

## Comparison of total antioxidant activity in currants measured by FIA/ECD

### Total antioxidant activity in currants measured by FIA/ECD

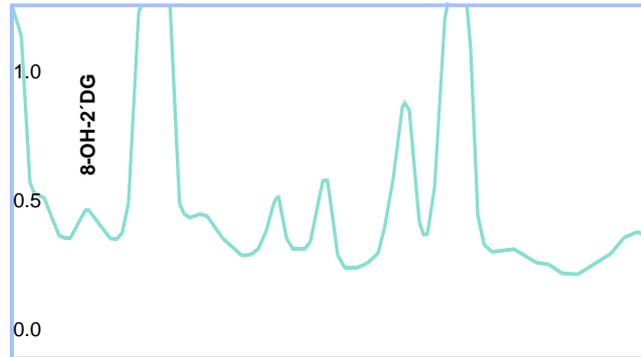

Total antioxidant activity in cherries measured by FIA/ECD

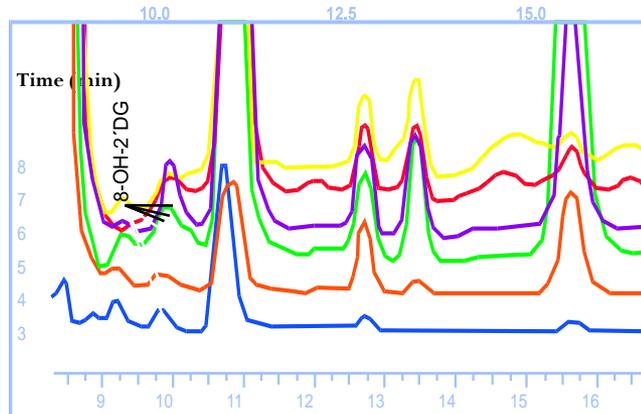

# 8-OH2'dG In Urine

What appears to be a single 8OH2'dG peak by conventional HPLC-ECD is actually found to be a co-elution of several metabolites by CoulArray detection!

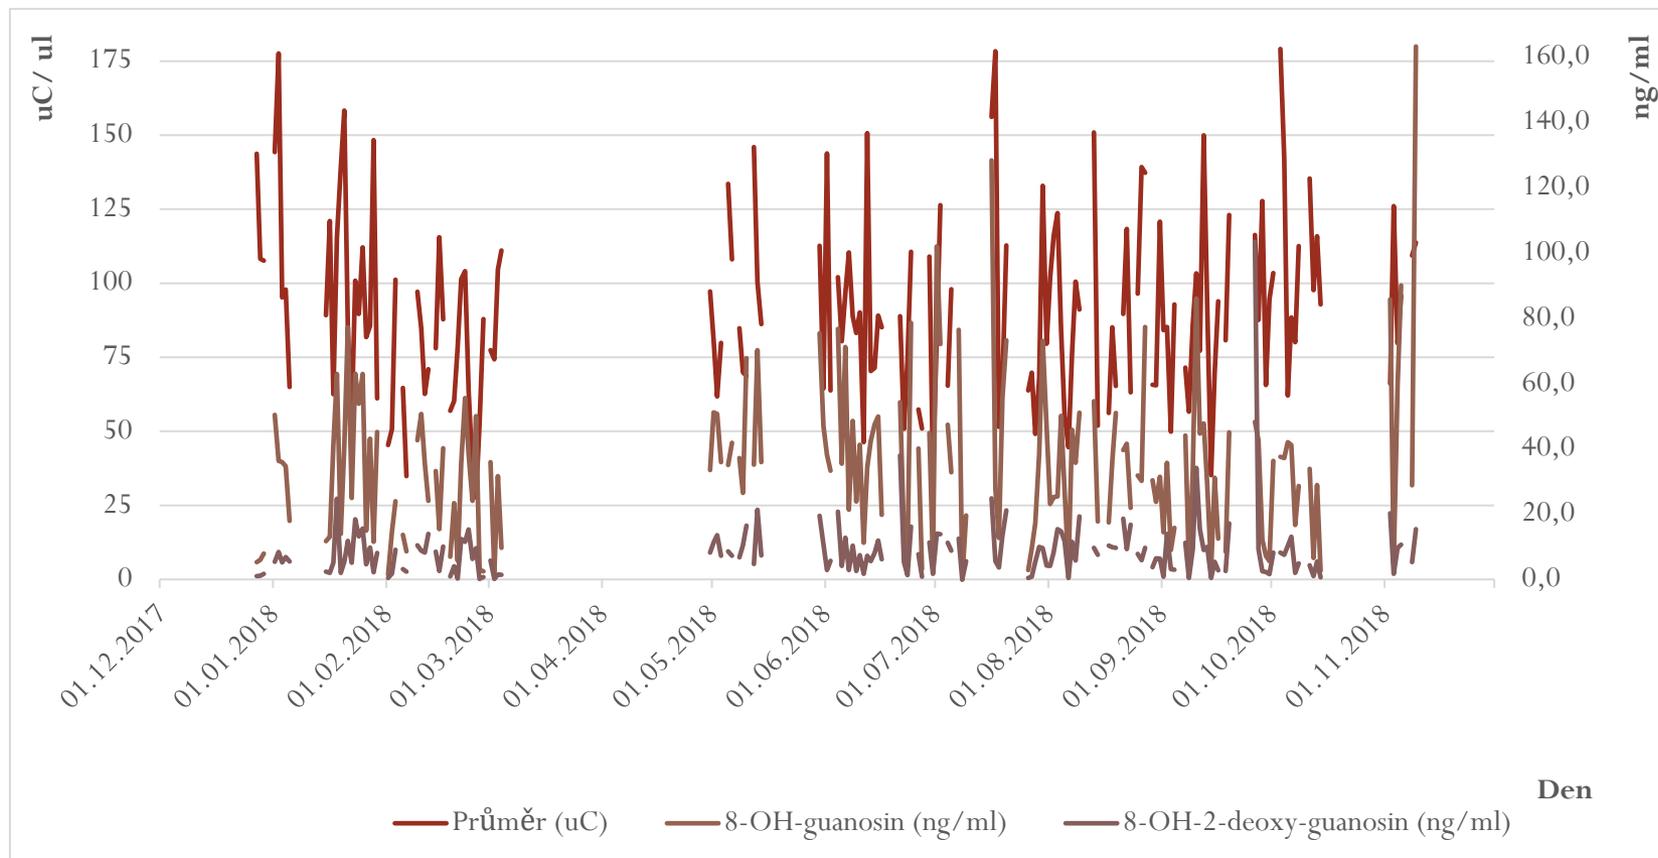

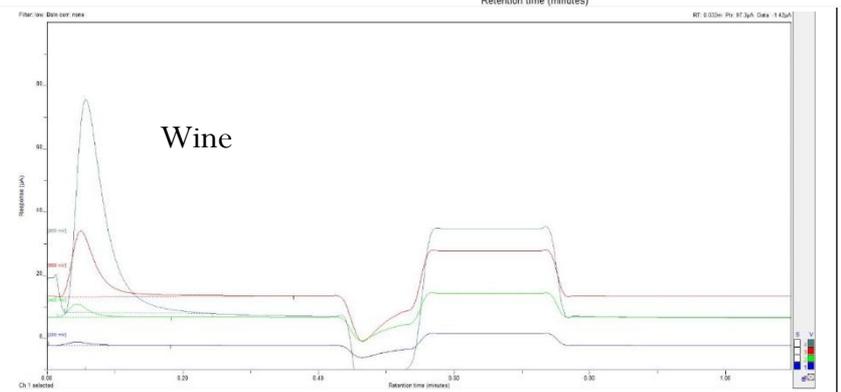

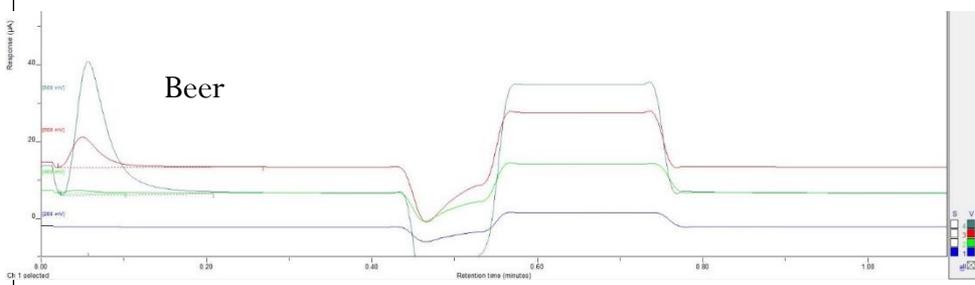

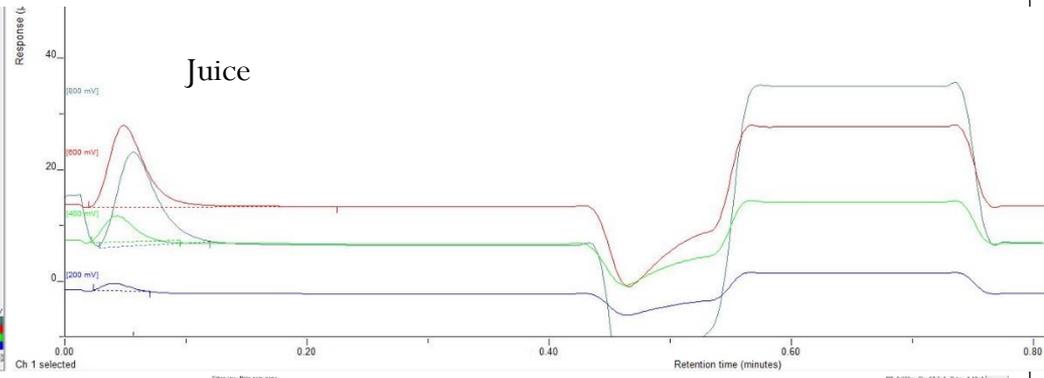

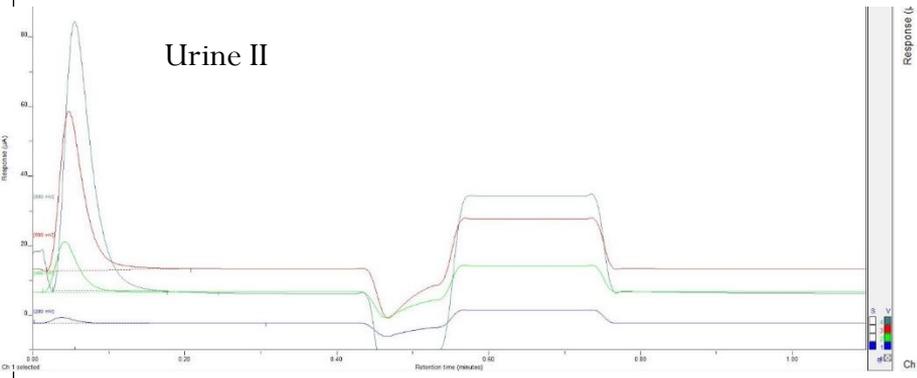

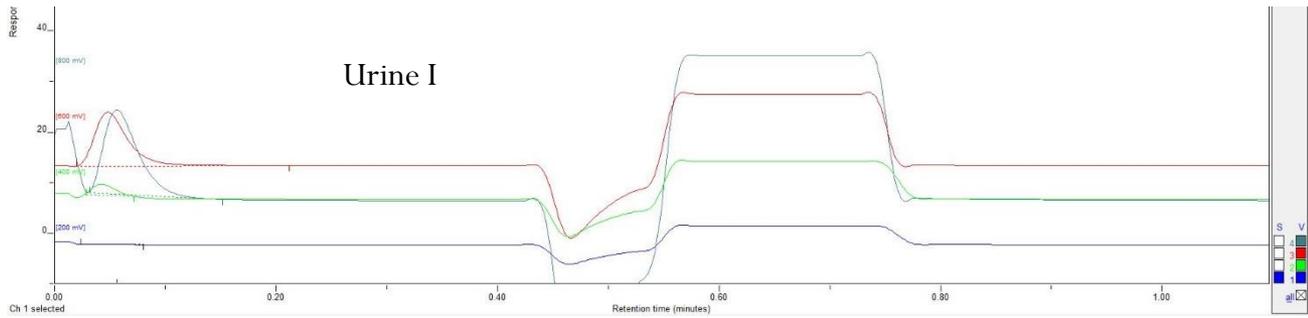

Conventional

CoulArray
