## Determination of chemical contaminants in marine fish by GCMS/MS using QuEChERS as an extraction method

## - Introduction

As Persistent Organic Pollutants (POPs) are environmental contaminants with a strong potential for bioaccumulation, these chemicals are expected to be present in farm animals and food products of animal origin. ${ }^{[1]}$ In recent years, the occurrence of various POPs, in the marine environment has received much attention with regards to their effects on human health. Especially in India, marine water is contaminated due to uncontrolled disposal from industries and domestic waste. Hence the fish obtained from it has high risk of contamination.
Evidently, it becomes necessary to have sensitive, accurate, reliable, reproducible and fast analytical method to quantify these POPs in marine fish at ppb levels.
Fish is a complex matrix and hence requires selective extraction and extensive cleanup such as QuEChERS (Quick Easy Cheap Effective Rugged Safe) to ensure trace level detection with adequate precision and accuracy. In this study, Shimadzu GCMS-TQ8040 was used in Multiple Reaction Monitoring (MRM) mode to analyze POPs like Organo-Chlorine Pesticides (OCP), Polycyclic Aromatic Hydrocarbons (PAH) and Poly-Chlorinated Biphenyls (PCB).
Prawns sample purchased from local market was extracted, spiked and analyzed for obtaining LOD, LOQ, precision and recovery.

## - Experimental

Extraction of pesticides from prawns:
Extraction of pesticides was done using modified AOAC QuEChERS method, as given below ${ }^{[2]}$.
Remove the shell of prawns. Take 10 g of finely grounded prawns sample.
Add 10 mL of water. Homogenize the sample and Keep it for 30 min .

Add 10 mL of acetonitrile containing $0.5 \%$ acetic acid.
Immediately, add QuEChERS salts containing $6 \mathrm{~g} \mathrm{MgSO} 4+1.5 \mathrm{~g} \mathrm{NaAcetate}$ (Restek® Coropration, Catalog \# 26238)

Shake and vortex for 1 min.

Centrifuge at 5000 rpm for 5 min .

Allow to stand for 1 min for phase separation

Draw 6 mL from upper extract of acetonitrile for further cleanup

Transfer the extract to dSPE (dispersive Solid Phase Extraction) tube containing 1200 mg anhydrous MgSO4, 400 mg PSA (Primary secondary amines) and 400 mg C18 (Restek® Corporation, Catalog \# 26221). Vortex for 2 min.

Centrifuge the mixture at 5000 rpm for 5 min .

Collect the supernatant and filter through a $0.2 \mu \mathrm{~m}$ PTFE membrane filter

## MRM method development

Individual mixtures of OCP, PAH and PCB standards were procured from Restek®. For analyzing OCP, the MRM transitions existing in Smart Database were used. For PAH, they were obtained from existing application data and imported in Smart Database. In case of PCB, MRMs were optimized. For optimization, about 1 ppm standard mixture of PCB was analyzed using scan mode. Retention times of individual components were identified and precursor ions were selected. Using selected precursor ion, product ion scan was performed with different Collision Energies (CE). For each component of PCB, MRM transitions with appropriate CEs were determined (Refer Figure 1). All the above steps were simplified with the help of Smart MRM optimization tool. These optimized MRMs for PCB were then registered to Smart Database containing transitions of OCP and PAH. From this, the final method with optimum segments (Refer Figure 2) and minimum three MRM transitions per compound was generated. The mixture of OCP, PAH and PCB was analyzed using the created method and the MRM chromatogram for the same is shown in Figure 3.

## Results and Discussion

Prawns sample was extracted to prepare matrix blank, which was spiked with various concentration levels of POPs to prepare matrix match or post-extraction spike linearity. Using this linearity parameters like LOD, LOQ, precision were studied. Against this linearity, pre-extraction spike was analyzed to study the recoveries.

## Application No. GC-13-ADI-013

## Note

Figure 3. MRM Chromatogram for 10 ppb POPs mixture in prawns matrix

## Summary of the results

Relative Standard Deviation (\% RSD) for 5 ppb standard solution ( $n=5$ ) was less than $15 \%$ for all components. Calibration plot of matrix match standards ranging from 1 ppb to 50 ppb concentration level showed linear response with $\mathrm{r}^{2}$ more than 0.995 . Recoveries for the prawns sample spiked with 5 ppb standard mixture were in the range of 70 to $130 \%$. The statistical data obtained for PAH, PCB and OC is shown in Table 2, 3 and 4 respectively.

Table 2. Quantitation results for PAH

| ID | PAHs | Retention time (min) | Target MRM (m/z) | $\mathrm{r}^{2}$ | S/N at 5 ppb at LOQ level | \% RSD at LOQ level ( $\mathrm{n}=5$ ) | \% Recovery at LOQ |

Note * : For these compounds LOQ was 10 ppb

## - Conclusion

Shimadzu GCMS-TQ8040 with Smart MRM feature was able to optimize MRM transitions with ease.
New Smart Database tool creates method with optimum segments leading to increased dwell-time, which resulted in achieving high sensitivity for trace level quantitation of POPs in complex matrix like prawns.
The MRM method developed for POPs can be used for screening of pesticides in various marine fish products. For $90 \%$ of the POPs, LOQ of 5 ppb was achieved.
